

Part A — Ritual Map

Why the loop is this short

The Refusal Clause already rules out tracking or interpreting, so there's nothing to intervene on before or after. The whole ritual collapses into one moment: you point, it magnifies, you're done.

Part B — Speed Bump

SPEED BUMP
Hold ⌘M to activate

Release early and nothing happens.
A tap doesn't count — only a held press.

Why the friction:

Makes turning it on a decision, not
a reflex. Costs half a second every time.

Part B — Companion

COMPANION
Ready when you need it

Take your time.
No timer, no pressure to be quick.

Why the warmth:

Eyesight tools can feel like an admission
of weakness. This one greets you instead.

Part B — Instrument Panel

Part C — Signature Interaction

SIGNATURE INTERACTION

Three states of the same lens

1. OFF

No motion. Nothing to see, so nothing renders.

2. ON — sensing

One brief 150ms fade-in on toggle-on. That's the only animation in the whole tool.

3. ON — not sensing

Looks nothing like state 1 (off) or state 2 (working). A dead lens and an off lens read as two different problems, because they are.

The seam I'm leaving visible: state 3 exists today only as a `console.error()` — not on screen yet.

Reflection

Which direction best supports awareness + dignity, and why?

Instrument Panel. Speed Bump and Companion both add something extra to justify the interface, and that's the problem: they treat magnifying small text like a behavior that needs managing or softening, which isn't what this tool is for. Needing your eyes helped isn't a craving to interrupt or a wound that needs gentle handling, it's just a fact, so the interface should treat it like one instead of narrating it. Instrument Panel doesn't ask anything of you before it works and doesn't cushion the fact that you used it afterward. That's what the Refusal Clause already said; this direction just puts it on the screen instead of only in the docs.
